# Int 21H, AH=33H, AL=03H

## Version

3.4/4.0

## Brief

GET CURRENT CPSW STATE

## Family API

## Input

AX = 3303h

## Return

DL = current CPSW

## Macro

## Notes

this function and AX=3304h were intended to support a proposed code-page switching flag (using the WORD at offset 0Ch in the DOS directory entry for codepage information); however, this function has always been a NOP in public releases of DOS and OS/2. See [\\_DOS\\_Internals\\_ Chapter 2](#) for more information. the released MS-DOS 4.00 IO.SYS has an undocumented CONFIG.SYS directive named CPSW= and that beside others the MS-DOS 4.00 ATTRIB

supported a number of undocumented special parameters for "predefined" Extended Attributes (EAs) e.g. ATTRIB filename [(CODEPAGE|CP)[=new\_value]].  
this function does not use any of the DOS-internal stacks and may thus be called at any time. It is directly dispatched from the INT 21h entry point with interrupts disabled.
