Int 21H, AH=29H

Version

1 and higher

Brief

PARSE FILENAME INTO FCB

Family API

Input

```
AH = 29h
AL = parsing options (see #01380)
DS:SI -> filename string (both '*' and '?' wildcards OK)
ES:DI -> buffer for unopened FCB
```

Return

AL = result code

```
    00h successful parse, no wildcards encountered
    01h successful parse, wildcards present
    FFh failed (invalid drive specifier)
DS:SI -> first unparsed character
ES:DI buffer filled with unopened FCB (see #01345)
```

Notes

asterisks in the name are expanded to question marks in the FCB

all processing stops when a filename terminator is encountered

cannot be used with filespecs which include a path (DOS 2+)

Novell NetWare monitors the result code since an 'invalid drive' may signal an attempt to reconnect a network drive; if there are no connections to the specified drive, NetWare attempts to build a connection and map the drive to the SYS:LOGIN directory

Bitfields for parsing options:

Bit(s)	Description
0	skip leading separators
1	use existing drive number in FCB if no drive is specified, instead of setting field to zero
2	use existing filename in FCB if no base name is specified, instead of filling field with blanks
3	use existing extension in FCB if no extension is specified, instead of filling field with blanks
4-7	reserved (0)
