## Int 21H, AH=56H

### Version

2 and higher

### Brief

"RENAME" - RENAME FILE

### Family API

### Input

```
AH = 56h
DS:DX -> ASCIZ filename of existing file (no wildcards, but see below)
ES:DI -> ASCIZ new filename (no wildcards)
CL = attribute mask (server call only, see below)
```

### Return

```
CF clear if successful
CF set on error
    AX = error code (02h, 03h, 05h, 11h) (see #01680)
```

### Notes

allows move between directories on same logical volume

this function does not set the archive attribute (see #01420 at AX=4301h), which results in incremental backups not backing up the file under its new name

open files should not be renamed

(DOS 2.x only) this function renames file by creating a new directory entry with the new name, then marking the old entry deleted

(DOS 3.0+) allows renaming of directories

(DOS 3.1+) wildcards are allowed if invoked via AX=5D00h, in which case error 12h (no more files) is returned on success, and both source and destination specs must be canonical (as returned by AH=60h). Wildcards in the destination are replaced by the corresponding char of each source file being renamed. Under DOS 3.x, the call will fail if the destination wildcard is \*.\* or equivalent; under DR DOS 5.0, the call will fail with error code 03h if any wildcards are used. When invoked via AX=5D00h, only those files matching the attribute mask in CL are renamed.

under the FlashTek X-32 DOS extender, the old-name pointer is in DS:EDX and the new-name pointer is in ES:EDI (DS must equal ES)

BUG: (DR DOS 3.41) when invoked via AX=5D00h, this function will generate a new directory entry with the new name (including any wildcards) which can only be removed with a sector editor
