# Int 2EH

## Version

2 and higher

## Brief

PASS COMMAND TO COMMAND INTERPRETER FOR EXECUTION

## Family API

## Input

```
DS:SI -> commandline to execute (see #02585)
```

## Return

```
all registers except CS:IP destroyed
AX = status (4DOS v4.0)
  0000h successful
  FFFFh error before processing command (not enough memory, etc)
  other error number returned by command
```

## Macro

## Notes

```
this call allows execution of arbitrary commands (including COMMAND.COM
internal commands) without loading another copy of COMMAND.COM
if COMMAND.COM is the user's command interpreter, the primary copy
```

executes the command; this allows the master environment to be modified by issuing a "SET" command, but changes in the master environment will not become effective until all programs descended from the primary COMMAND.COM terminate

since COMMAND.COM processes the string as if typed from the keyboard, the transient portion needs to be present, and the calling program must ensure that sufficient memory to load the transient portion can be allocated by DOS if necessary

results are unpredictable if invoked by a program run from a batch file because this call is not reentrant and COMMAND.COM uses the same internal variables when processing a batch file

hooked but ignored by 4DOS v3.0 COMMAND.COM replacement unless SHELL2E has been loaded

the MS-DOS 5 Programmer's Reference calls this "Reload Transient"
