

This is part of **Family API** which allow to create dual-os version of program runs under OS/2 and DOS

Note: This is legacy API call. It is recommended to use 32-bit equivalent

2021/09/17 04:47 · prokushev · [0 Comments](#)

This call returns the video display configuration.

Syntax

VioGetConfig (ConfigID, ConfigData, VioHandle)

Parameters

;ConfigID (USHORT) - input: Identifies for which display configuration information is being requested:
::0 - Current configuration ::1 - Primary configuration ::2 - Secondary configuration :For OS/2 1.2, when ConfigID = 0, the current configuration is returned rather than the primary configuration (as was returned in OS/2 1.0 and 1.1). This change makes the OS/2 mode version of VioGetConfig match the family API version that has returned the current configuration starting with OS/2 1.0. OS/2 1.0 and 1.1 applications that issued VioGetConfig to determine the display configuration benefit from this change. The application can run on the configuration selected by the operator (by issuing the MODE command before invoking the application) rather than switching away from the operator selected display. ;ConfigData (PVIOCONFIGINFO) - output: Address of structure where the display configuration is returned. ;VioHandle (HVIO) - input : This must be zero unless the caller is a Presentation Manager application, in which case it must be the value returned by VioGetPs.

Return Code

;rc (USHORT) - return:Return code descriptions are: *0 NO_ERROR *421 ERROR_VIO_INVALID_PARMS *436 ERROR_VIO_INVALID_HANDLE *438 ERROR_VIO_INVALID_LENGTH *465 ERROR_VIO_DETACHED

Remarks

The values returned may not be correct if the adapter cannot be properly identified by the Base Video Handler (BVH) selected at system installation time. It can also be incorrect if the physical setup does not match that indicated by the presence of the adapter or by adapter switches. For example, it is impossible to detect the absence of a display on a CGA or the display attached to an EGA, despite the setup switches.

Bindings

C

```
<PRE> typedef struct _VIOCONFIGINFO { /* vioin */
```

```
USHORT  cb      ;           /* Length of this data structure */  
USHORT  adapter;           /* Display adapter type */  
USHORT  display;          /* Display/monitor type */  
ULONG   cbMemory;         /* Amount of memory on the adapter  
                           in bytes */  
  
USHORT  Configuration;
