Fundamental concepts

- client - separate program using the PM API. There could be several clients on different machines. Client is a program, which at present time must have application type "Windowable"
- server - server, who operates clients. The server displays the Desktop picture on one or several devices. The server communicates with the clients, also, the communication between the clients is possible

the number of client, issued by server after connecting with the client

HAB - handle ancor block - the index of thread, which issues and server stores.

```
    During the transmittal to the client of index the server checks the
presence
        in list of client and thread ordinal.
        Index is an index of the element of the massif of structure
_FreePM_HABserverinf
        see also client structure _FreePM_HABinf
```

HWND - handle window the index of window, issued by server to client. Index is an

```
    index of the element of the massif of structure struct WND
```

DC - divays context. khz that this is such in ibiyemerov. the index of the massif of

```
    structures F_.DC. structure contains the number of divaysa, khendl of
window.
        to?eshche what- thread.
```

HPS - Handle Presentation Space. the index of the massif of structures F_PS, which

```
    does contain DC, the current color, the current type of line, the current
        initial point? something, that describes the geometry of the visible
range of window?.
```

the communication they can be transferred between the windows if communication must

```
    be transmitted between the windows of one client, then it does not exceed
the
        limits of the client
```

Turn of the communications

```
    there is on the server and on the client
```
